PROTOTYPE · OCTOBER 2026

GoBiz

Real projects for students.
Real help for small companies.

Micro-projects · Internships · Jobs, matched with AI that suggests and people who decide.

WHY

The problem

Small companies

Need a dashboard, a clean database or an automated Excel report. Not enough to hire someone for it.

Students

Need real experience, mandatory practice and a portfolio. A CV line like "I know Power BI" proves little.

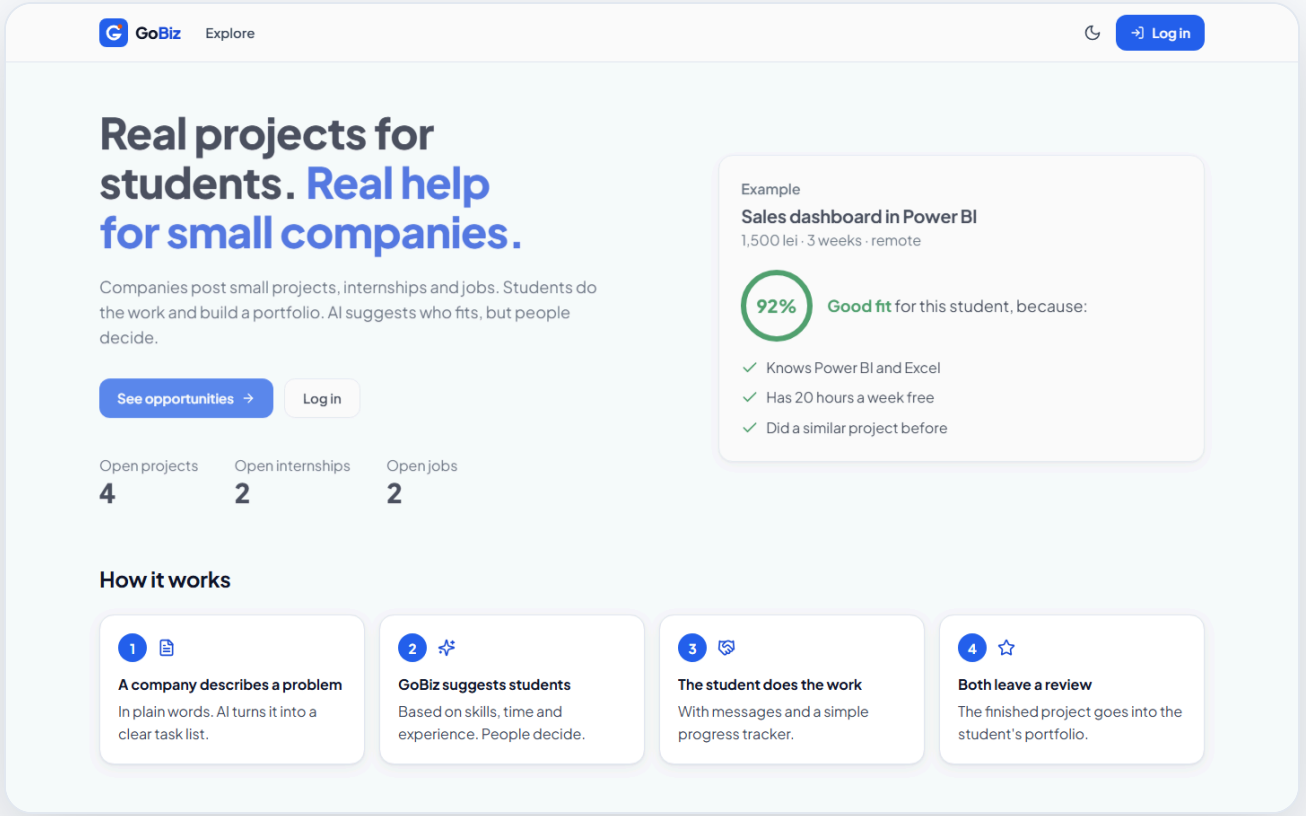

Universities

Have little data on which skills companies actually ask for.

WHAT

The idea

- One platform with three tabs: **Projects**, **Internships**, **Jobs**
- Each side says what it is looking for, for example a year-2 student who only needs the mandatory practice
- Not "students matched with jobs", but **student skills matched with real company problems**
- AI **suggests**; students and companies **decide**

FLOW

How it works

1

Describe

The company writes the problem in plain words.

2

Match

AI turns it into tasks and skills and suggests students.

3

Work

Apply or invite, select, messages, progress tracker.

4

Review

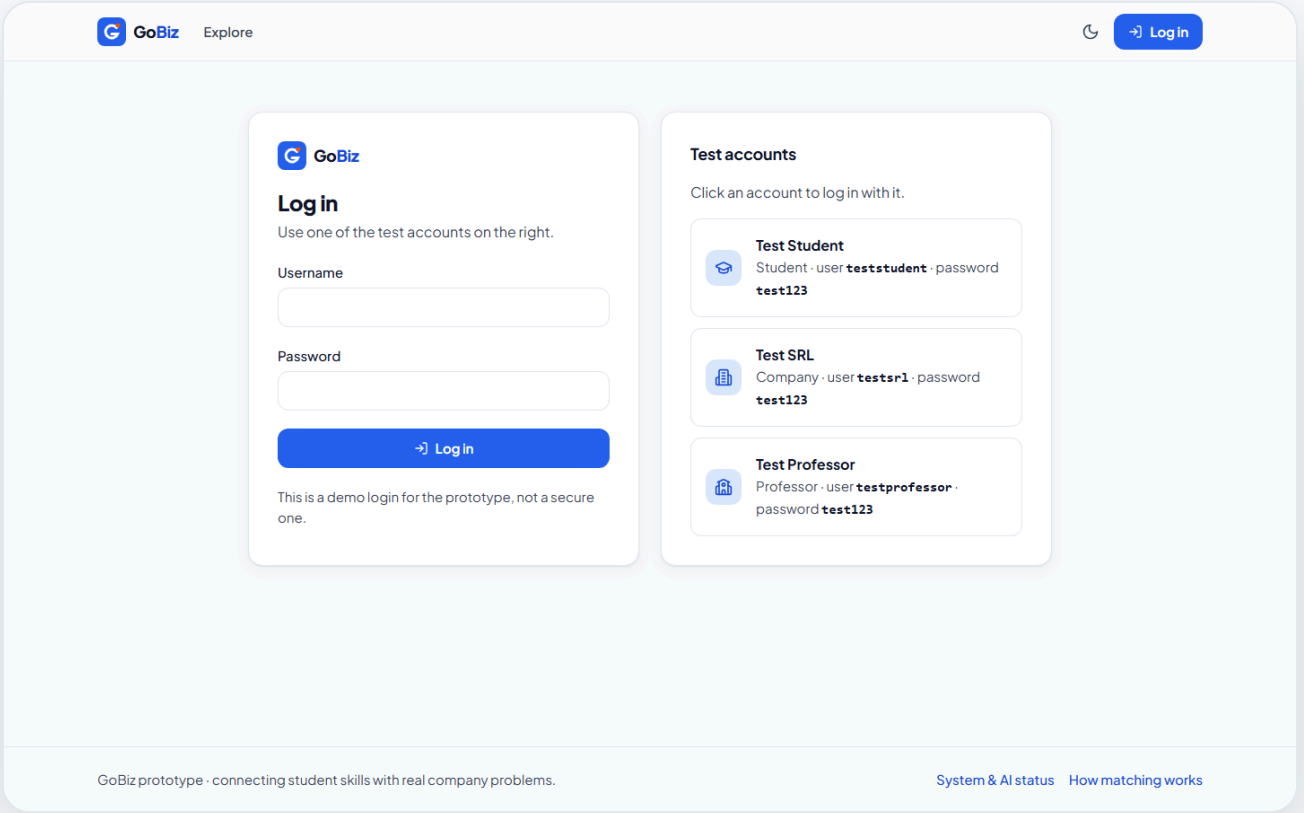

Both sides rate each other. The project enters the student's portfolio.

DEMO

Three test accounts

- **Test Student**: finds work and builds a portfolio
- **Test SRL**: posts work and picks students
- **Test Professor**: mentors, validates, reads the statistics

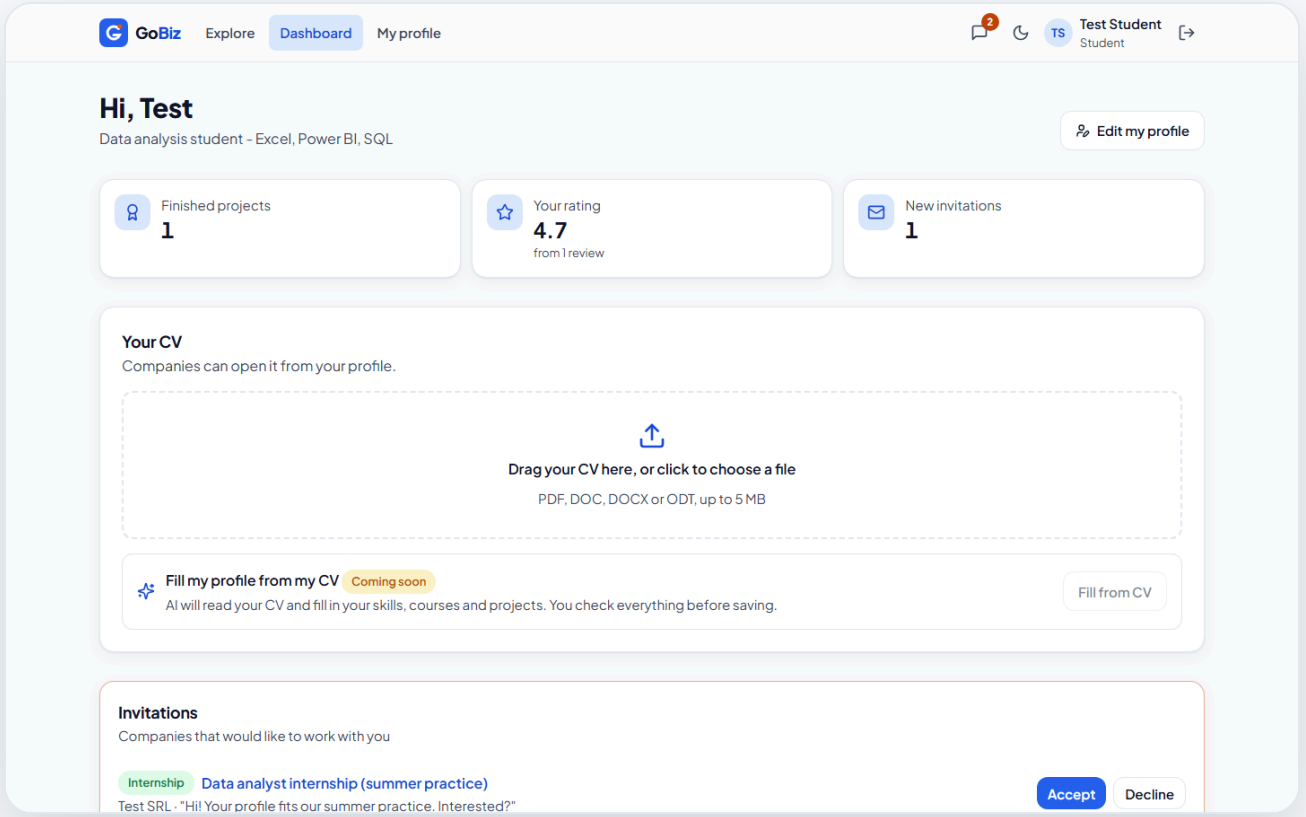

Mock login for the prototype, with a small demo dataset (2 students, 2 companies).

STUDENT

Student dashboard

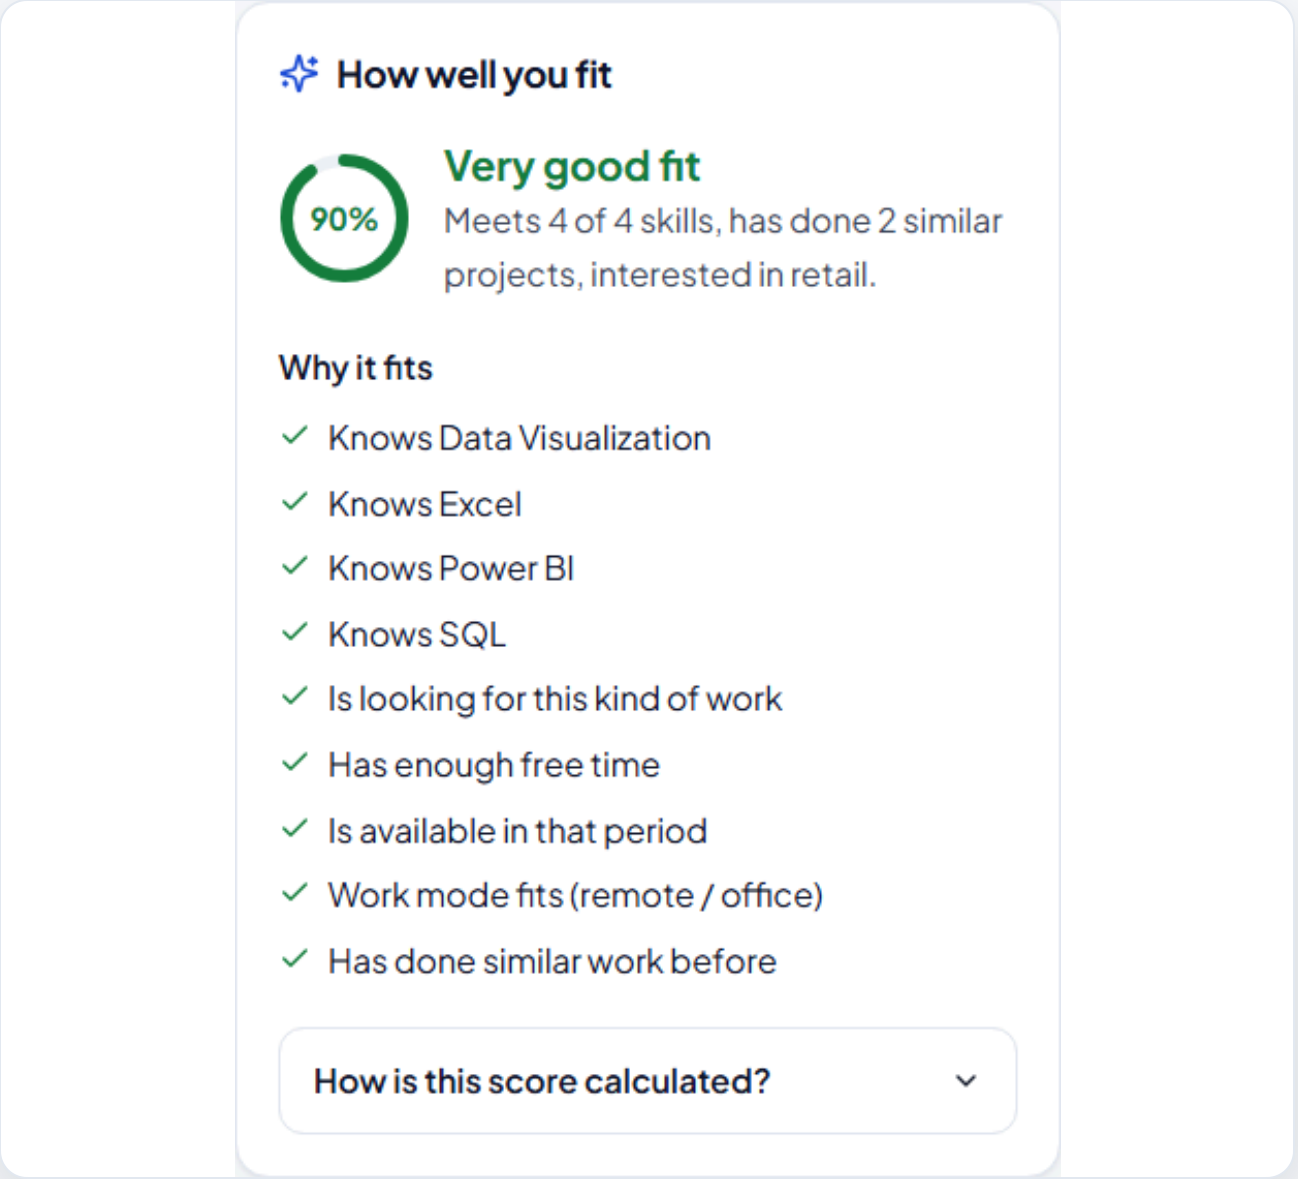

- Invitations from companies
- Current work
- Recommendations per tab, with a fit label
- Verified portfolio with ratings

STUDENT

Why does it fit?

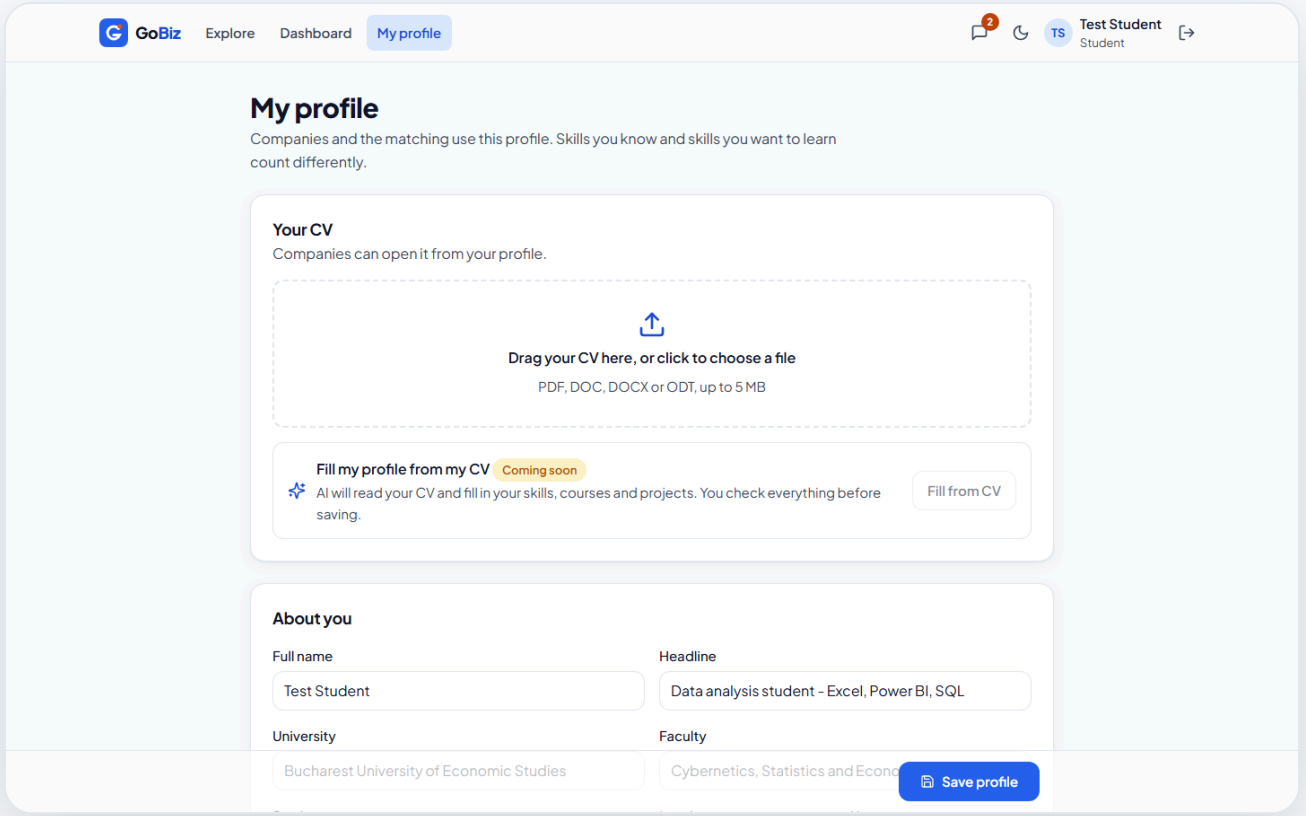

- Plain reasons: "Knows Power BI", "Has enough free time"
- Problems and things to check, when there are any
- The score details are one click away
- Only a suggestion: students can apply anywhere

STUDENT

CV section

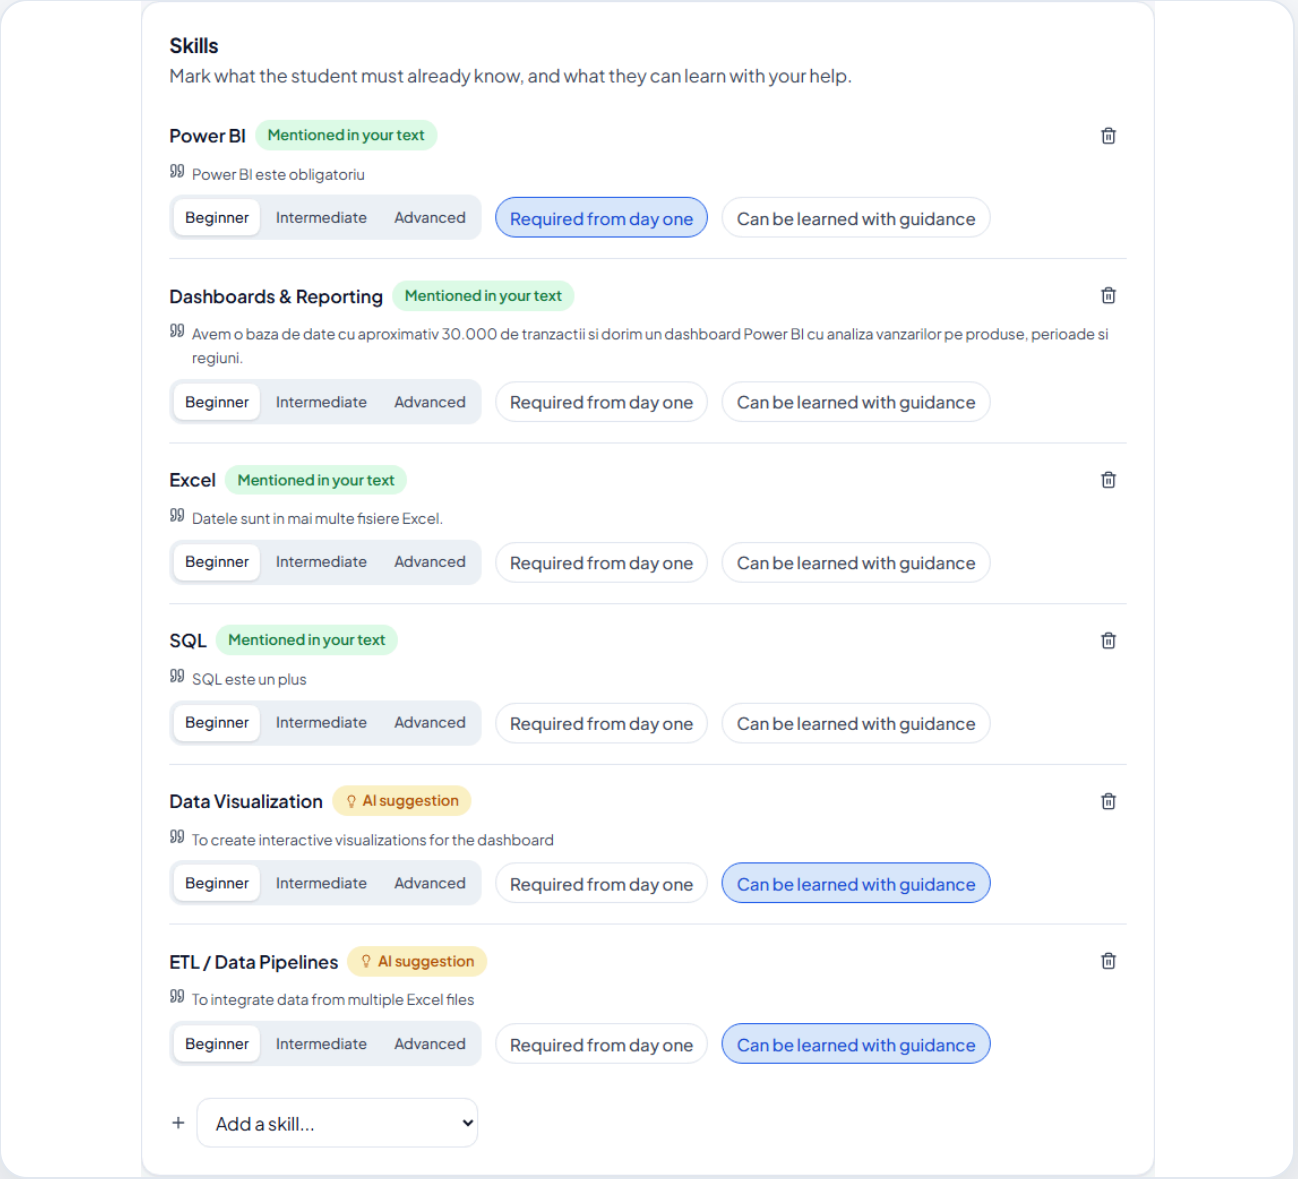

- Upload by drag and drop: PDF, DOC, DOCX, ODT
- Companies can open it from the profile
- **Next:** the local AI reads the CV and fills skills, courses and projects for the student to confirm

COMPANY

AI reads the company's text

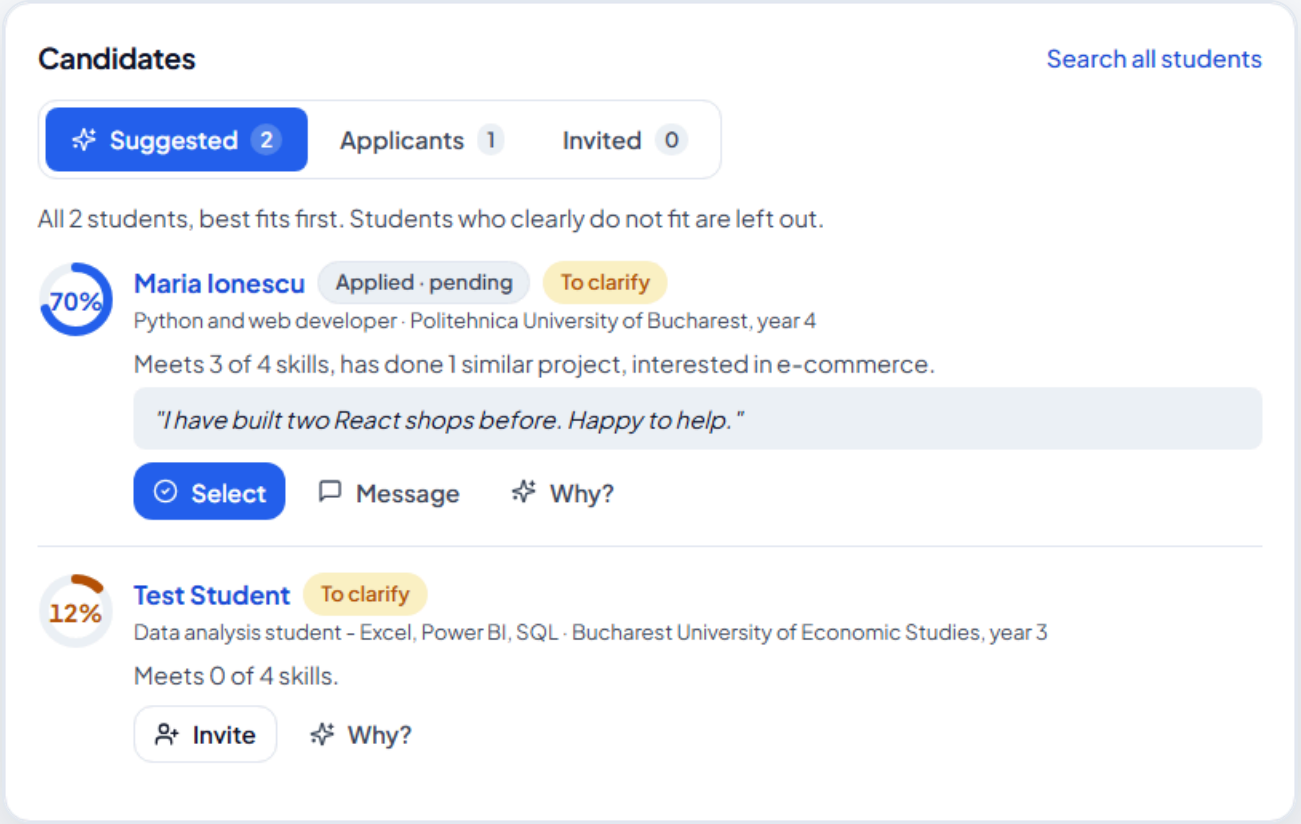

- Romanian or English, written freely
- A local model (Qwen3 1.7B) extracts tasks, skills and open questions (shown: the skills it found)
- Rules check it: "required" vs "nice to have" comes from the company's own words
- The company confirms everything before publishing

COMPANY

Candidates

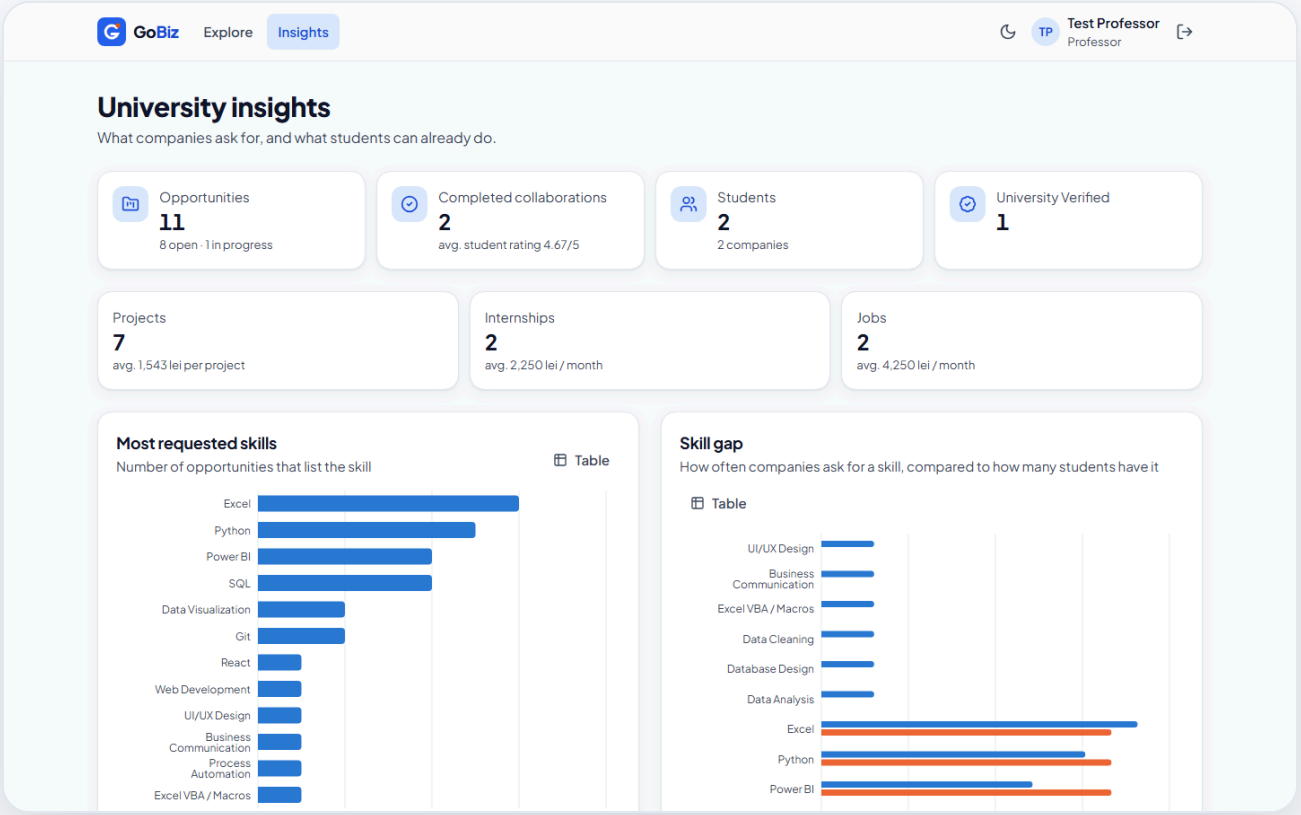

- **Suggested**: every student, best fits first
- **Applicants** and **Invited**
- "Why?" explains each suggestion
- Message, invite or select any student

PROFESSOR

University insights

- Skills companies ask for most
- Skill gap: demand vs. what students have
- University Verified projects and mentorship requests
- Input for updating the curriculum

ALGORITHM

How the matching works

score = 50% skills + 25% experience + 15% interests + 10% text similarity

1

Filter

Type of work, hours, period, remote or office, required skills. A clear mismatch means "Not a fit".

2

Score

Skills you know and skills you want to learn count differently. Verified projects count more.

3

Explain

Every result comes with plain reasons and things to check.

4

Learn later

Every action is logged, so a trained model can replace the rules once there is real data.

AI

AI that runs on a normal PC

Measured on a GTX 1050 Ti (4 GB), i5-9400F, 16 GB RAM:

Model	Where	Speed	One extraction
qwen3:4b	GPU, did not fit	0.4 tokens/s	timeout
qwen3:4b	CPU	1.8 tokens/s	minutes
qwen3:1.7b	GPU, fully	**~34 tokens/s**	**5–15 s**

Embeddings: multilingual MiniLM (Romanian + English). Everything has a fallback, so the app works even without the AI.

STACK

Technology

App

React, TypeScript, Tailwind · FastAPI (Python) · one container

Data

MySQL · optional Neo4j skill graph

AI

Ollama + Qwen3 · sentence-transformers

Only open-source components and no paid services. `docker compose up` starts everything on one PC (3 containers). 37 automated tests and an offline evaluation of the matching.

ROADMAP

Next steps

- AI fills the student profile from the CV
- Real authentication and secure accounts
- Pilot with a few SMEs and one faculty
- Learn better weights from real applications and ratings
- Payments and contracts
